

ABSTRACT OF THE DISCLOSURE

In case of driving each of light emitting parts of a surface emitting laser, each of light emitting parts is made to be in
5 forward-bias state and switches appropriately change bias voltage, which is lower than laser oscillation threshold voltage, and drive voltages, which are not less than the laser oscillation threshold voltage to directly apply the changed voltage to each of drive ends of the light emitting parts.

10 Whereby, each of light emitting parts is driven.
